-!- EUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS.

-!- CAPALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).

-!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                 THE ENZYME (BY SIMILARITY).

-1- ENZYME REGULATION: REGULATED BY CALCIUM/CALMODULIN (IN CONTRAST WITH MOUSE NOS2).

ENZYME AND EFECTS MAY BE EXERTED AT THE LEVEL OF THIS ENZYMESAID AND EFECTS MAY BE EXERTED AT THE LEVEL OF TRANSLATIONAL/POSTTRANSLATIONAL MODIFICATION AND DIRECTLY ON THE CATALYTIC ACTIVITY (BY SIMILARITY).

-1- SUBBUIT: HOMODIMER.

-1- TISSUE SPECIFICITY: EXPRESSED IN THE LIVER, RETINA, BONE CELLS AND AIRWAY EPITHELIAL CELLS OF THE LUNG. NOT EXPRESSED IN THE

IN MACROPHAGES, NO MEDITATES FUNCKIONS AND BACTORINS. MAY BE INVOLVED IN THE PATHOGENESIS OF DILATED CARDIOMYOPATHY OR OF EXERCISE INTOLERANCE OBSERVED IN PATIENTS WITH CHRONIC HEART FAILURE.
CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).
COPACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHURNESHOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF

"Molecular cloning and characterization of Ca2+-dependent inducible
nitric oxide synthase from quinea-pig lung.";
Blochem. J. 333:795-799(1998).
-I- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE
WITH DIVERSE FUNCTIONS THROGGHOUT THE BODD.
NITRIC OXIDE + N NADP(+).

COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROSIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE ENZYME (BY SIMILARIY).

ENZYME REGULATION: REGULATED BY CALCIUM/CALMODULIN (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -i- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + N NTRIC OXIDE + N NADP(+).

BERKETH THE SARCOLEMENT

(WITH THE DYSTROPHIN GIRCOPPENS.)

(ALTERNATIVE PRODUCTS: FIVE ISOFORMS; N-NOS-1 (SHOWN HERE), N-NOS-2, NOSO BETA, NOSO GAMA AND NNOS MU/MUSCLE-SPECIFIC; ARE PRODUCED BY ALTERNATIVE SPLICING.

(TISSUE SPECIFICITY: WIDELY EXPRESSED IN THE NERVOUS SYSTEM: EXPRESSED IN CREBELLUM, OLFACTORY BULB, HIPPOCAMPUS, NIDBRAIN, CREBELLUM, OLFACTORY BULB, HIPPOCAMPUS, AND BRAIN, CREBELLUM, DNS, MEDULLA GOLONGATA, AND STRINAL CORD. ALSO FOUND IN SKELETAL MUSCLE, WHERE IT IS LOCALIZED BENEATH THE SARCOLEMMA OF FAST TWITTEN MUSCLE FIBERS, AND IN SPLEEN, HEART, KIDNEY, AND IN SKELETAL AND STRAND OF THE NERVOUS SYSTEM. NNOS BETA AND GAMMA OCCUR IN A REGION-SPECIFIC MANNER IN THE BRAIN AND NNOS BETA EXPRESSION IS DEVELOPMENTALLY REGULATED. NNOS MU IS ONLY FOUND IN MATURE SKELETAL AND CARDIAC MUSCLES.

(INDUCTION: BY CHOLINERGIC AGONISTS ACTING AT INOSITOL PHOSPHATE-INDUCTION: BY CHOLINERGIC AGONISTS ACTING AT INOSITOL PHOSPHATE-ISOFORM PARTICIPATES IN PROTEIN PROPERIN IN WISCLES.

(INDUCTION: BY CHOLINERGIC AGONISTS ACTING AT IN MUSCLES.)

(INDUCTION: BY CHOLINERGIC AGONISTS ACTING AND IS RESPONSIBLE FOR TARGETING NNOS TO SYNAPTIC MEMBRANES IN MUSCLES.)

(INDUCTION: BY CHOLINERGIZ NON SYNAPTIC MEMBRANES IN MUSCLES.)

(INDUCTION: BY CHOLINERGIZ NON SYNAPTIC MEMBRANES IN MUSCLES.)

THE SANCOLEMBE OF FASTITMITCH MUSCLE FIBER BY ASSOCIATING WITH THE DYSTROPHIN GIRCOPROTEIN COMPLEX.

1. ALTERNATIVE PRODUCTS: 4 ISOFORMS; N-NOS-1 (SHOWN HERE), N-NOS-2, TN-NOS/TN-NOSB AND TEXZ INSERTION; ARE PRODUCED BY ALTERNATIVE SPLICING. TN-NOS/TN-NOSB AND TEXE PRODUCED BY ALTERNATIVE SPLICING. TN-NOS/TN-NOSB LEADING TO A NH2-TRUNCATED EXONS TEXI (TN-NOS) OR TEXT EXD (TN-NOS) LEADING TO A NH2-TRUNCATED PROTEIN WHICH POSSESSES ENXYMATIC ACTIVITY COMPARABLE TO THAT OF N-NOS-1. THE COOH-TRUNCATED TEXZ INSERTION ISOFORM IS PRODUCED BY INSERTION OF THE TEXZ EXON BETWEEN EXONS 3 AND 4 OF THE N-NOS-1 ISOFORM, LEADING TO A FRAMESHIFT AND A PREMATURE STOP CODON.

1. TISSUE SPECIFICITY: THE N-NOS-1 ISOFORM IS UBIQUITOUSLY EXPRESSED: DEFECTED IN SKELFALM MUSCLE AND BRAIN, ALSO IN TESTIS, LUNG AND KIDNEY, AND AT LOW LEVELS IN HEART, ADREAD CHAND AND RETINA. NOT DETECTED IN THE PLATELETS. THE TN-NOS ISOFORM IS DETECTED ONLY IN THE TESTIS. THE TN-NOS ISOFORM IS DETECTED ONLY IN THE TESTIS. THE TN-NOS ISOFORM IS DETECTED IN THE BRAIN BUT NOT IN THE HEBRY AND ADDREAD GLAND.

1. DOMAIN: THE PDZ DOMAIN IN THE N-TERMINAL PART OF THE NEURONAL ISOFORM PARTICIPATES.

1. SOFORM PARTICIPATES IN PROTEIN-PROTEIN INTERACTION, AND IS EXPRESSED.

1. SOFORM PARTICIPATES IN PROTEIN-PROTEIN INTERACTION, AND IS EXPRESSED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Function:
A; Description: catalyzes the oxidation of an L-arginine guanidino nitrogen and of NADPH C; Superfamily; GLGF domain homology; flavodoxin homology; NADPH--ferrihemoprotein reduct C; Keywords: calmodulin binding; chromoprotein; flavoprotein; heme; iron; metalloprotein; F; 22-95, Domain: GLGF domain homology <GLG>
F; 725-134, Domain: NADPH--ferrihemoprotein reductase homology <FEH>
F; 755-134, Domain: NADPH--Ferrihemoprotein reductase homology <FEH>
F; 757-935, Domain: Flavodoxin homology <FLX>
F; 881-912, Region: FMN binding #status predicted
F; 1027-1038, 1170-1180, Region: NADP binding #status predicted
F; 1245-1263, 1343-1358, Region: NADP binding #status predicted
F; 125, Binding site: heme iron (Cys) (axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Cross-references: EMBL:X59949; NID:g57528; PIDN:CAA42574.1; PID:g57529

                                                                                                                     This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriaais, and multiple sclerosis. This sequence in expresents a peptide from human iNOS which is used in the method of the

tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide fragment from human iNOS which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human inos which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              monoclonal antibody; mimić; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autolmmune disease; multiple sclerosis.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                               nitric oxide synthase; iNOS; human; immunoassay; detection;
                                                                                                           monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; Mab.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence encoded by the cDNA clone for human hepatocyte inducible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. Nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, used for isolated tissue perfusion treatment to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for gene therapy for enhancing and inducting angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amino acid sequence of a human inducible nitric oxide synthase (NOS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene therapy, anglogenesis; nucleic acid delivery; arteriosclerosis;
nitric oxide synthase; NOS; endothelial dysfunction.
                                  An inducible nitric oxide syntase (1NOS or AAR88464) is the product of a CDNA clone (AAT10115) derived from human hepatocytes induced for iNOS blosynthesis. The 1NOS can be obtd. by expression of the CDNA e.g. in mammallan host cells and is used in the development of selective inhibitors of NOS or to treat diseases
                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                              AAQ66914 is from human hepatocyte inducible nitric oxide synthase cDNA clone pHINOS from lambda Zap II cDNA library. The original source was induced human hepatocyte RNA. HINOS cDNA plasmid is pref. transformed in E. coll SOLK (ATCC 69126). The inventors claim a clone with the cDNA sequence in AAQ66914 and a cDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase cDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with

                                                                                                                                                                                                                                                                                                                                                                                Use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, especially useful in gene therapy for enhancing and/or inducing angiogenesis and treating atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase (NOS) activity for the manufacture of a composition for essentially isolated tissue perfusion treatment to enhance and/or induce anglogenesis. The nucleic acid delivery vehicle is particularly useful in gene therapy for the treatment of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence

                                                                                                                                                                                                                                                                                                ;
                                                                                                                specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNoS) or mimics of this protein is used to detect the presence of human iNoS protein in the sample. The method can be used for the detection and quantitation of human iNoS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide fragment from rat inoS which is used in the method

cellular calcium levels. Vectors contg. the DNA are used in the treatment or prevention of vascular diseases, high blood pressure, arteriosclerosis, stenosis or restenosis of blood vessels, esp. coronary vessels after percutane transluminal coronary angioplasty. See AAR77363 and AAR77362 for endothelial and brain-derived NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to two DNA molecules encoding inducible nitric oxide synthase (iNOS) proteins, where the DNA molecules comprise defined sequences of 4041 and 4165 base pairs given in the specification and the proteins have 1144 amino acids. Also claimed are expression vectors containing the DNA molecules, and recombinant host cells containing the vectors. The DNA molecules are useful for producing the recombinant proteins. The present sequence represents inducible nitric oxide, long
                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding inducible nitric oxide synthase proteins – useful for producing recombinant proteins
